How I Used Bootstrap 5

1 Which Bootstrap 5 components and examples were used and why?

For the purpose of this project there components used were Navbar, Carousel, Progress, List Group, Collapse and Dropdown. These were the major components used and chosen based on their ease of implementation, as well as them being the most appropriate for the making of a writing portfolio

2 How as the layout structured using the grid system?

The layout was structured according to the fluid container commands provided by Bootstrap, a very useful method of structuring that omits the necessity of measuring and placing text and other elements of the webpage as is required in standard HTML and CSS coding.

3 Was any custom CSS used and what was its purpose?

Yes, custom CSS was used for the purpose of this project, in part because it was reused from the CSS 2 hands-on assignment, and it provided an additional layer of customization to the main page that complimented the CSS options provided by Bootstrap. It also provided a valuable lesson in how to implement custom CSS with other types of CSS configurations.

4 Were any challenges faced, and how were they solved?

There were some initial challenges in regards to the implementation of code and how to adjust and properly implement borrowed examples from the Bootstrap documentation, as well as getting it to mesh properly with the custom CSS. There were also some initial challenges with understanding exactly how the component code worked in general, but through thorough reading and trial and error I was able to fully grasp how things worked and make the webpage visible and less jarring and cluttered

5 Were there any other learning points?

Understanding how external CSS actually works, how to properly link items within the same page as well as from external pages, how to use Bootstrap to its full potential and how to format text inside HTML while making it easy to read and not an eyesore for the user.
